

NO-CODE MACHINE LEARNING, START TO FINISH

ML Studio

The Machine Learning Platform for Any Dataset, Any Problem

Upload any tabular dataset and go from raw data to a deployed, explainable prediction model - no code, no data science team, and no black-box guesswork along the way.

17 Algorithms

9 Connected Modules

5 Model Families

Auto Problem Detection

Building a good model still takes a data team and months

Most organisations either lack the bandwidth to build models systematically, or ship models nobody stress-tested before go-live.

The Coding Bottleneck

EDA, feature engineering and model training mean stitching together notebooks, scripts and BI tools by hand.

One-Algorithm Bias

Teams try one or two familiar algorithms instead of systematically benchmarking many - leaving accuracy on the table.

Black-Box Deployment Risk

Models ship without calibration checks, learning curves or residual diagnostics - failure modes surface in production, not before.

One continuous workflow, from raw file to deployed model

Upload a CSV or Excel file. ML Studio auto-detects whether the target is a regression or classification problem and activates the full pipeline.

Everything below is live in the current build - this deck maps directly to what a client would click through.

9 connected modules, four stages of the ML lifecycle

FOUNDATION

- Guided Data Upload (CSV / Excel)
- Data Overview & Auto Problem Detection

EXPLORE & ENGINEER

- Exploratory Data Analysis (7 views)
- Feature Engineering Studio
- No-code formula & date builder

MODEL & COMPARE

- Guided ML Modeling Wizard
- Model Leaderboard
- Deep-Dive Diagnostics

DEPLOY & SCORE

- Live Scores & Risk Filtering
- Batch Prediction on New Data

Data overview - with automatic problem-type detection

Rows

≡

Columns

%

Missing %

0-9

Numeric Columns

Target & Problem Type

Pick a target column and let the platform auto-detect Classification vs. Regression - or override manually. A live badge confirms the detected mode before anything downstream runs.

Variable Selector

Select All, Clear All, Numeric Only or Categorical Only with one click - or hand-pick exactly which columns feed EDA and modelling. Target column is always protected.

Column Summary & Preview

A full column-quality profile (type, missingness, uniqueness) plus a live 200-row data preview - so nobody trains a model on data they haven't actually seen.

Seven exploratory views - no separate BI tool required

Every chart is interactive (zoom, hover, filter) and every underlying table is exportable.

A no-code feature engineering studio - with a real formula language

Most no-code tools stop at charts. ML Studio lets you build genuinely new variables - then hands you back the reproducible script.

Date / Time Decomposition

One click extracts age, tenure, year, month, quarter, day-of-week, weekend flag and days-since from any date column.

IF / Conditional Formula Builder

Build conditions visually or write them directly - e.g. `IF([Status]=="Active", expr, expr)` - with nested IF support and nine comparison operators.

Free-Form Formula Evaluator

Full custom expressions using [Column] references, evaluated and previewed before being applied to the dataset.

Every Change Is Tracked

Nothing here is a black box - every transformation is logged and reversible:

Full Feature Engineering Log with Undo Last / Reset All

One-Hot, Label or Target Encoding, previewed before applying

Export the engineered dataset as CSV

Generate & download the equivalent script for full reproducibility

17 algorithms across five families - trained on one fair recipe

Every algorithm you select runs on the identical prepared dataset, so leaderboard comparisons are apples-to-apples.

LINEAR	REGULARISED	TREE-BASED	NON-LINEAR	ENSEMBLE
• Linear Regression • Logistic Regression • Linear Discriminant (LDA) • Generalized Linear Model	• Ridge Regression (L2) • Lasso Regression (L1) • Elastic Net (L1+L2)	• CART • C4.5 Decision Tree	• SVM - RBF Kernel • SVM - Polynomial • k-Nearest Neighbors • MARS	• Random Forest • XGBoost • LightGBM • Bagged Decision Tree

Select algorithms individually, or one click per family (All / Linear / Tree-Based / Non-Linear / Ensemble) - train in parallel and watch the training log update live.

A guided six-step wizard - with production-grade preprocessing

1. Analyse

2. Prepare

3. Algorithms

4. Evaluate

5. Tune

6. Finalize

Step 2 - Prepare (the step most tools skip)

- Missing values: median/mode, mean/mode, or row removal
- One-hot encoding, feature normalisation, near-zero-variance removal
- Optional PCA (95% variance retained)
- Class imbalance: SMOTE, ROSE, upsample or downsample
- Adjustable train/test split (50–90%) with stratification and a fixed random seed

Steps 3–6 - Train, Compare, Tune, Deploy

- Train every selected algorithm in one click; live training log tracks progress
- Evaluate: performance cards, confusion matrix / residuals, ROC / predicted-vs-actual
- Tune: grid or random hyperparameter search with adjustable CV folds & metric
- Real-time feature-importance (VIP) plot updates as tuning runs
- Finalize: set the active model that powers Scores, Diagnostics and Batch Predict

Model leaderboard - one composite score, fully transparent

Composite Score Ranking

A normalised average across every available metric, so one number reflects overall model quality - or rank by any single metric (Accuracy, F1, ROC-AUC, Kappa, RMSE, MAE, R^2).

Grouped Model Comparison

Pick any models and any metrics for a side-by-side bar chart, with an optional training-time overlay on a secondary axis.

Tuned-Model Indicator

A ⚙️ marker instantly shows which leaderboard entries were hyperparameter-tuned versus trained with defaults.

One-Click Export

Download the full leaderboard as CSV, or click any row to pre-select that model in the Finalize step.

Deep diagnostics - the checks most teams skip before go-live

Every chart ships with a plain-English “How to read this” panel - diagnostics a business user can actually act on.

Calibration Curve

Reliability diagram showing whether predicted probabilities match observed frequencies.

Precision-Recall Curve

The right lens when positives are rare - sharper signal than ROC on imbalanced classes.

Cumulative Gains & Lift

“Contact the top 20%, capture 70% of positives” - read directly off the chart for targeting use cases.

Learning Curves

Training-size vs. performance, to diagnose underfitting, overfitting, or a data ceiling.

Residual / Probability Diagnostics

Class-separation and ROC for classifiers; residual distribution and residuals-vs-fitted for regressors.

Hyperparameter tuning - watch performance improve live

Tuning Controls

- 8 tuneable algorithms: Random Forest, XGBoost, Ridge, Lasso, Elastic Net, SVM-RBF, kNN, CART
- Regular grid or random search, with adjustable CV folds and grid points
- Optimise for accuracy, ROC-AUC, F1, RMSE, R^2 or MAE
- Built-in Tuning Guidance & Best Practices panel

Live Feedback While It Runs

- Parameter-performance results table, sortable and exportable to CSV
- Feature-importance (VIP) plot updates in real time as the search progresses
- Cancel a long-running search at any point without losing prior results
- Best configuration feeds straight into the Leaderboard and Finalize step

From finalised model to predictions on brand-new data

Live Scores

- KPI scorecards adapt to problem type: Accuracy/AUC/F1 for classification, RMSE/R²/MAPE for regression
- Distribution, Performance (ROC or Residuals) and Gain & Lift views in one tabbed panel
- Filter test predictions by High/Medium/Low risk or by high-error residuals
- Adjustable Top-N and one-click CSV export

Batch Prediction

- Upload any new, unseen dataset; automatic column validation against the trained model's requirements
- Run the active model with one click and get instant summary KPIs and a distribution chart
- Export all predictions, high-risk only, or a formatted Excel file
- Save results directly to browser storage for later reference

No-code on the surface. Fully reproducible underneath.

Fair, Apples-to-Apples Benchmarking

Every algorithm trains on the identical prepared recipe, so leaderboard rankings are trustworthy, not cherry-picked.

Deployment-Grade Diagnostics

Calibration, lift/gain and learning curves ship standard - checks most teams only add after something breaks.

Truly Reproducible

Generates the actual script behind every engineered feature, plus a downloadable model object.

Works With Any Tabular Dataset

Auto-detects regression vs. classification and adapts every module to what the data supports.

Everything Is Exportable

Datasets, scripts, leaderboards, predictions and model objects all download - no vendor lock-in.

One Continuous Workflow

Explore, engineer, train, tune, diagnose and deploy without leaving a single application.

What actually sets ML Studio apart

Not a features list - the reasons a technical buyer would choose this over a notebook, a BI tool, or a bigger AutoML platform.

01

Zero Code, Full Power

17 algorithms, enterprise-grade preprocessing and hyperparameter tuning - with no notebook, no script, no environment to manage.

02

Fair-by-Design Benchmarking

Every algorithm trains on the identical recipe. The leaderboard reflects true model performance, not who got the better preprocessing.

03

Diagnostics Most Tools Skip

Calibration curves, lift & gain, and learning curves ship standard - deployment risk gets caught before go-live, not after.

04

Genuinely Reproducible

Every engineered feature exports as real R code; every finalised model exports as a portable object. Nothing here is a black box.

05

One App, Entire Lifecycle

EDA, feature engineering, training, tuning, diagnostics and batch scoring - without switching tools or re-uploading data.

06

Any Dataset, Zero Setup

Auto-detects regression vs. classification from the target column and adapts every module instantly - no per-project configuration.

NEXT STEPS

Let's build your first model together.

Bring a real dataset and we'll go from upload to a trained, tuned and diagnosed model live inside the platform.
