

WORKFORCE INTELLIGENCE, END TO END

People Analytics

The Workforce Intelligence Platform

One system that takes raw HR data from upload to executive dashboards, attrition prediction, compensation equity, workforce forecasting and employee segmentation - with no coding and no external data transfer.

14 Connected Modules

12 ML Algorithms

30+ Interactive Visuals

0 External Dependencies

PREPARED FOR PROSPECTIVE CLIENTS

HR data is scattered. Decisions shouldn't be.

Headcount lives in one export, salary in another, exits in a third. By the time the numbers are stitched together, the moment to act on them has passed.

Fragmented Data

Headcount, salary, exits and demographics sit in separate spreadsheets that never quite reconcile.

Reactive, Not Predictive

Attrition is discovered after resignation letters land - there is no early warning system flagging who is at risk.

Slow, Expensive Insight

Board-ready people analytics takes weeks of analyst time, BI tooling, or an outside consultant.

One platform. Every stage of the people-analytics lifecycle.

Upload a single CSV or Excel file. The platform auto-detects available columns and activates every module it can support - no data engineering project required.

Everything below is live in the current build - this deck maps directly to what a client would click through.

14 connected modules, four analytical layers

Executive Command Center - every KPI, one screen

Twelve live infoboxes track headcount, prior-year comparison, hires, exits, blended / voluntary / involuntary turnover, average age, tenure and gender ratio - refreshed instantly whenever filters change.

Workforce composition - and every categorical cut beyond it

Demographics is the starting point, not the ceiling. The Categorical EDA explorer auto-detects every text/category column in the uploaded file and makes it instantly explorable.

Standard demographic views

Department, gender, employee type, location, grade, age & tenure distributions - each with its own live infobox row.

Diversity indices

Automatically computed diversity/concentration scores per category, not just raw headcounts.

Cross-tab heatmap

Any two categorical variables plotted against each other to reveal composition patterns (e.g. Department × Gender, Grade × Location).

Categorical EDA Explorer

Point it at ANY category column - not just the demographic ones - and get:

Bar chart breakdown

Treemap composition

Cross-tabulation vs. any 2nd variable

Auto-detected up to 50 category levels

Works on custom client-specific fields

Compensation intelligence & pay-equity analytics

A dedicated compa-ratio engine most workforce dashboards leave out entirely - turning salary data into a defensible pay-equity story.

Compa-Ratio Analysis

Salary ÷ grade midpoint for every employee, with distribution by grade and below/at/above-midpoint breakdown.

Salary Distribution

Overall and by-department median salary views for the active workforce.

Grade Salary Bands

Min / P25 / Median / P75 / Max banding per grade, visualized as a single band chart.

Grade × Pay Equity Heatmap

Median salary heatmap crossing grade against any category (dept, gender, location) to surface equity gaps.

Within-Grade Percentiles

Every employee ranked within their own grade, with a downloadable percentile table.

Salary vs. Attrition

Median salary and compa-ratio compared for exited vs. active employees - is pay a driver of exits?

Understand why people leave, not just that they left

Attrition Analysis

- Voluntary vs. involuntary turnover, tracked separately and combined
- Turnover trend by month/quarter with hires, exits and net change
- Attrition sliced by department, grade, tenure band and demographic cuts
- Early-attrition flag for exits inside the first 2 years

Workforce EDA

- Full numeric correlation heatmap across every measured feature
- Distribution explorer - histogram, density or box plot, grouped by any category
- Hire-cohort survival curves showing retention by joining cohort
- Time-to-exit distribution to spot seasonal or tenure-linked exit clusters

12 machine learning algorithms - zero data-science team required

A guided six-step wizard walks any HR user from raw data to a deployed prediction model.

1. Analyze Data

2. Prepare Data

3. Train Models

4. Compare Results

5. Tune Parameters

6. Finalize & Deploy

LINEAR

- Logistic Regression
- Linear Discriminant Analysis
- PLS Discriminant Analysis
- Stepwise Logistic Regression

NON-LINEAR

- k-Nearest Neighbors
- Naive Bayes
- SVM (RBF Kernel)
- MARS

ENSEMBLE / TREE

- CART
- Random Forest
- Gradient Boosted Machine
- Bagging CART

Configurable preprocessing (missing-value strategy, class-imbalance handling, centering/scaling), adjustable train/test split and cross-validation folds, per-algorithm hyperparameter tuning, and side-by-side metric comparison to pick a winner before it's deployed as the active scoring model.

Every employee scored. Every new hire screened.

Employee Risk Scores

- Finalized model scores the entire active workforce automatically
- Risk-tier breakdown (Low / Medium / High) with distribution chart
- Top-25 high-risk employee list with live filters
- Full transparency into which model is active and how it was trained

Batch Prediction

- Upload any new dataset - downloadable template guarantees the right format
- Adjustable probability threshold decides what counts as 'high risk'
- Instant predictions with probability scores for every record
- One-click export: all predictions, high-risk only, or model summary

See around the corner: forecast, plan, and protect key roles

Advanced Headcount Forecast

ETS time-series forecasting with confidence intervals, filterable by department, 3-24 month horizon.

Workforce Flow

Hires vs. exits vs. net change tracked together to see whether growth plans are realistic.

Hiring Demand Planner

Enter a growth target, expected attrition and open roles - the platform back-calculates exactly how many hires are needed.

Succession Risk Register

Weighted risk score (60% tenure ≥ 5 yrs + 40% age ≥ 55) flags departments with succession exposure.

Talent Flow by Department

Chart or table view of movement between departments over time.

Scenario Comparison

Compare hiring scenarios side by side with auto-generated planning insights.

Segment your workforce the way marketers segment customers

K-means/PAM clustering on any mix of variables - with automatic, plain-English interpretation of what each segment means.

Adjustable segment count ($k = 2$ to 8) on any selected variables

Optimal-k finder using elbow method and silhouette score

PCA visualization of segments with auto-generated quality rating
(Excellent / Good / Weak / Poor)

Segment profile table and dendrogram for hierarchical structure

Segment vs. business-metric explorer - compare segments on turnover, salary, tenure or any KPI

Correlation funnel: rank every variable's relationship to any chosen target

Insights that write themselves - on data you can trust

Smart Insights

Automatically generated insight cards and prescriptive next-actions, computed entirely from the uploaded data.

- Context-aware scorecard summarizing current workforce state
- Insight cards that update with every filter change
- Dedicated prescriptive-actions panel - not just charts, but recommended responses
- Runs entirely on the platform - no internet call required to generate insight

Data Quality Audit

Before any dashboard or model is trusted, the platform profiles the data feeding it.

- Completeness KPIs at a glance
- Missing-value chart by column
- Column-type distribution profiling
- Full column-quality table - exit-only fields correctly scoped so active employees don't skew missingness

Built for HR leaders - not just data scientists

No-Code, Guided Workflows

Every advanced technique - from ML training to clustering - is wrapped in a step-by-step wizard a non-technical HR user can run.

Data Never Leaves Your Environment

Insights, including Smart Insights, are generated on-platform with no external API or internet dependency.

Descriptive → Predictive → Prescriptive

One continuous workflow instead of separate BI, ML and planning tools stitched together.

Everything Is Exportable

Every table and prediction set downloads to CSV - no vendor lock-in on the outputs.

Works With Any HR Dataset

Auto-detects available columns and activates whichever modules the data supports.

Built-In Data Trust Layer

Data quality auditing runs before analysis, so every downstream number is defensible.

NEXT STEPS

Let's put your workforce data to work.

Bring a sample export and we'll walk through your own headcount, attrition and compensation data live inside the platform.
